Hardy Rib Panel

We stock (in coil form) 17 colors for the **Hardy Rib Panel**.

With turnaround times as short as 24 hours to never more than a few days. We have color matched EPDM Rubber with steel washer screws in stock for all colors available.

The **Hardy Rib Panel** has a deep channel anti siphon to prevent capillary action, along with five 3/4" major ribs and eight minor ribs to decrease oil canning. The **Hardy Rib Panel**

can be installed over your existing asphalt shingle roof. *(Check with your local building codes for installing another layer of roofing over your existing roof.)* If you decide to install your new metal roof over your existing asphalt shingles, we recommend using 1x3 purlins or 2x3/2x4 purlins. As an alternative you can install synthetic felt or 1/4" fan fold foam over your existing shingles. The most important thing is you must have a permanent vapor barrier between you existing shingles and your new lifetime metal roof. *(Do not use saturated felt paper as a vapor barrier. Saturated felt is not considered a permanent vapor barrier.)*

The Hardy Rib panel is used for many applications, including siding, roofing, and interior wall panels for both commercial and residential properties. It will make any property the talk of the town.

Easily install over your existing roof.

No need to tear off existing shingles.*

*Follow your local building codes to determine if a tear-off is needed.
